🌱 AI-Powered Environmental Story Generator Prompt

ROLE

You are a highly imaginative short story writer and futurist. You specialize in crafting compelling, emotionally engaging stories where advanced AI systems collaborate with humans to solve complex environmental problems beyond normal human thinking capacity.

INTRO

Write a vivid and engaging short story based on a given genre. The story must center around an environmental crisis and highlight how an advanced AI assistant plays a crucial role in solving it using intelligence, predictive analysis, and creative problem-solving that surpasses human limitations.

CONTEXT

The world is facing severe environmental challenges such as climate change, pollution, biodiversity loss,

CONTEXT

Free offer ×

Share

The world is facing severe environmental challenges such as climate change, pollution, biodiversity loss, water scarcity, or energy crises. Humans alone are struggling to find timely and scalable solutions.

An advanced AI assistant (you may name it creatively) is designed with superior analytical, predictive, and adaptive capabilities. It can process massive datasets, simulate future outcomes, and generate unconventional yet effective solutions that humans may not easily conceive.

The story should emphasize:

- Human limitations vs AI capabilities
- Collaboration (not replacement)
- Ethical and emotional dimensions
- Realistic or futuristic environmental solutions

INPUT DATA

Provide the following inputs:

- **Genre** (e.g., sci-fi, thriller, dystopian, adventure, mystery, etc.)
- **Environmental Problem** (e.g., ocean pollution, deforestation, air toxicity, water crisis, etc.)
- **Setting** (optional: future city, rural village, space colony, etc.)
- **Main Character(s)** (optional: scientist, student, activist, etc.)

Free offer ×

OUTPUT DATA

Generate a short story with the following structure:

1. **Title** – Creative and relevant
2. **Opening Hook** – A strong, engaging start
3. **Character Introduction** – Human + AI assistant
4. **Conflict** – Clear environmental problem with stakes
5. **Rising Action** – Failed human attempts + AI begins analysis
6. **AI Intelligence Showcase** –
   - Predictive modeling
   - Pattern recognition
   - Out-of-the-box thinking
   - Data-driven decisions beyond human reasoning
7. **Climax** – AI proposes and executes an innovative solution
8. **Resolution** – Problem solved or improved
9. **Closing Insight** – Reflection on AI-human collaboration and future implications

---

STYLE REQUIREMENTS

- Keep it highly engaging and cinematic

Preview

🌱 What is This?

An AI-powered storytelling platform where creativity meets environmental awareness. Generate immersive stories where advanced AI assistants help humans solve global crises.

⚙️ How It Works

🎭 Choose a genre

🌍 Define environmental problem

🧩 Customize characters & world

🔹 1. Zero-Shot Prompt

(No examples, just direct question)

Prompt:

> Meena has 500 rupees. She spent 180 rupees on a book and 250 rupees on a bag. How much money is left with her?

🔹 2. One-Shot Prompt

(One example before the actual question)

Prompt:

> Example:
> Ravi has 300 rupees. He spends 100 rupees on food and 50 rupees on transport. How much money is left?
> Answer: 300 - 100 - 50 = 150 rupees
>
> Now solve:
> Meena has 500 rupees. She spent 180 rupees on a book and 250 rupees on a bag. How much money is left with her?

🔹 3. Few-Shot Prompt

(Multiple examples before the actual question)

Prompt:

> Example 1:
> Anu has 400 rupees. She spends 150 rupees on groceries and 50 rupees on snacks. How much money is left?
> Answer: 400 - 150 - 50 = 200 rupees
>
> Example 2:
> Raj has 600 rupees. He spends 200 rupees on clothes and 100 rupees on shoes. How much money is left?
> Answer: 600 - 200 - 100 = 300 rupees
>
> Now solve:
> Meena has 500 rupees. She spent 180 rupees on a book and 250 rupees on a bag. How much money is left with her?

🔹 4. Chain-of-Thought Prompt

(Encourages step-by-step reasoning)

Prompt:

> Meena has 500 rupees. She spent 180 rupees on a book and 250 rupees on a bag. How much money is left with her?
>
> Let's think step by step:
>
> - **"Total money = 500 rupees"**
> - **"Total spent = 180 + 250 = 430 rupees"**
> - **"Remaining money = 500 - 430 = 70 rupees"**
>
> Final Answer: 70 rupees
